

HeeraMon

Application Automation Specification

Application Automation Specification Document

Date of Preparation: September 30, 2026

Document ID	HM-DOC-13
Title	Application Automation Specification
Classification	Application Automation Specification Document
Status	Draft
Version	1.0
Owner	Product / Engineering
Audience	All project contributors
Related Documents	Security Spec (HM-DOC-11), SRS (HM-DOC-02)

1 Purpose

This document defines how HeeraMon assists users with job applications.

The goal is to reduce repetitive application work while keeping the user in control of what is submitted.

2 Application Workflow

The application workflow is:

Select Job → Prepare → Review → Edit → Approve → Submit → Confirm

HeeraMon may automate preparation, but the user remains responsible for the final submission.

3 Application Preparation

After the user chooses to proceed, HeeraMon may collect and prepare:

- name and contact information;
- education;
- work experience;
- skills;
- CV;
- portfolio links;
- cover letter;
- application answers;
- other information already provided by the user.

The system should reuse verified user information rather than repeatedly asking for the same information.

4 Information Integrity

HeeraMon must never fabricate:

- employment history;
- education;
- certifications;
- skills;
- achievements;
- portfolio work;
- salary history;

- application answers presented as factual claims.

If required information is missing, HeeraMon should:

1. ask the user;
2. leave the field unresolved;
3. or identify that the application cannot yet be completed.

5 Application Review

Before submission, the user should see the information HeeraMon intends to submit.

The review should make important fields easy to inspect and edit.

At minimum, the user should be able to review:

- personal information;
- CV;
- experience;
- skills;
- generated written responses;
- cover letter;
- application-specific answers.

6 Human Approval

Submission requires an explicit user action.

Example:

Review complete. Ready to submit?

Actions:

- Approve & Submit
- Edit
- Cancel

The approval must be enforced by backend application state.

A prompt instruction such as “wait for user approval” is not sufficient protection by itself.

7 Submission Methods

The system may support application methods that are technically accessible and reliable, such as:

- supported application APIs;
- structured application systems;
- controlled browser automation where appropriate.

The architecture should isolate application-system integrations behind adapters.

Example:

```
Application  
  
Application Adapter  
  
External Application System
```

The core application workflow should not depend on one specific external platform.

8 External Application Requirements

Different employers may request different information.

The system should identify:

- required fields;
- optional fields;
- unsupported fields;
- missing information;
- unusual questions;
- external account requirements.

Unsupported or ambiguous requirements should be surfaced to the user rather than silently bypassed.

9 Submission Verification

HeeraMon must distinguish between:

- prepared;
- approved;
- submitted;
- submission failed;
- submission status unknown.

The system must not claim successful submission without sufficient confirmation from the external system.

10 Failure Handling

If submission fails:

- preserve the prepared application;
- explain what happened;
- avoid accidental duplicate submissions;
- allow the user to retry where safe.

If the submission status is uncertain, the system should not automatically retry a potentially duplicate application without determining whether the original submission succeeded.

11 Application History

The system should preserve useful application state, including:

- job;
- company;
- submission date/time;
- status;
- submitted materials;
- external application identifier where available;
- relevant errors.

This allows users to return later and understand what happened.

12 Security

Application automation must follow the security requirements in Document 11 (Security & Privacy Specification).

In particular:

- external content is untrusted;
- credentials must be protected;
- application actions require authorization;
- sensitive data must not be unnecessarily exposed to the LLM;
- automation must operate with limited permissions.

13 Boundaries

The initial release does not require:

- universal support for arbitrary application websites;
- CAPTCHA bypassing;
- defeating anti-bot mechanisms;
- autonomous account creation;
- autonomous application submission without review;
- sophisticated browser automation for every website.

The system should support a small number of reliable application paths and establish the complete human-controlled workflow.

14 Success Criteria

Application automation is successful when HeeraMon can:

1. Prepare an application using verified user information.
2. Identify missing information.
3. Generate useful application materials without fabricating facts.
4. Present the complete application for review.
5. Allow the user to edit or cancel.
6. Require explicit approval.
7. Submit through a supported integration.
8. Accurately report success, failure, or uncertainty.
9. Preserve application history.

Core principle: HeeraMon should automate the tedious parts of applying, not automate the user's decision to apply.

15 Document Control

Version	Date	Author / Role	Changes
1.0	September 30, 2026	Product / Engineering	Initial release

Approval: This document defines the application automation behavior for HeeraMon. All subsequent design and implementation work must remain consistent with the principles stated herein.

HeeraMon flies to help people find job that fits not only their career, but the life they want to live.
