## 1 What is HeeraMon?

HeeraMon is an AI-powered personal job-seeking assistant inspired by the mythical wisdom bird that advises its owner before important decisions.

Instead of making users repeatedly search job boards, fill complicated filters, and manually compare opportunities, HeeraMon allows them to simply describe the kind of work and life they want in natural language.

For example:

*“At least 40k BDT, AI/ML role, maximum 30-minute commute, around 7 hours a day, friendly workplace, subsidized lunch, and enough life outside work.”*

HeeraMon interprets these requirements, continuously searches available job opportunities, evaluates their suitability, remembers the user’s preferences, explains trade-offs, and presents relevant opportunities when they appear.

When the user chooses to apply, HeeraMon can prepare the application and assist with the process, while keeping the user in control of the final submission.

**Core idea:** Tell HeeraMon what kind of work you want. Let it search, reason, remember, and assist.

## 2 Product Philosophy

HeeraMon is built around five fundamental ideas:

1. **Conversation over configuration** — Users should be able to express their requirements naturally rather than filling long forms or configuring dozens of filters.
2. **Fit over volume** — The objective is not to maximize the number of jobs shown or applications submitted. HeeraMon should prioritize opportunities that meaningfully fit the user’s requirements and desired lifestyle.
3. **Continuous assistance over repeated searching** — The user describes their goal once. HeeraMon continues looking for relevant opportunities instead of requiring the user to repeatedly perform the same search.
4. **Wisdom over automation for its own sake** — HeeraMon should help users understand trade-offs rather than blindly maximizing a numerical match score or applying everywhere.
5. **Human control over consequential actions** — HeeraMon may search, analyze, prepare, and automate repetitive work, but important actions such as submitting an application remain subject to user approval.

### 3 What Makes HeeraMon Different?

Many existing job platforms focus on searching, filtering, ranking, autofilling, or applying to large numbers of jobs.

HeeraMon focuses on the relationship between the person and the job.

A user may say that salary, working hours, commute, technical role, workplace culture, and personal time all matter. These preferences may conflict. HeeraMon should understand those conflicts and communicate them clearly.

For example:

*“This opportunity matches your AI/ML requirement and salary expectation, but the commute is approximately one hour instead of thirty minutes and the workday is eight hours instead of seven. Would you still consider it?”*

HeeraMon should also learn from conversations and decisions. If a user repeatedly rejects opportunities below a certain salary, that preference can influence future searches even when the user did not explicitly repeat it.

Thus, HeeraMon is not merely a job search engine or an application bot. It is intended to become a personal job-seeking agent that understands what the user values.

### 4 Design Principles

1. **Minimalistic** — The interface should contain only what is necessary. Complexity should exist inside the system, not in front of the user.
2. **Premium and Human** — HeeraMon should feel polished, calm, intelligent, and intentional rather than like a generic enterprise dashboard.
3. **The Bird is the Interface Personality** — The wisdom-bird concept should appear naturally through subtle animation, dialogue, and interaction rather than excessive decoration.
4. **Natural Language First** — The primary interaction should be conversation. Structured controls may exist where useful, but they should support the conversation rather than replace it.
5. **Transparent Reasoning** — When HeeraMon recommends or rejects an opportunity, it should explain the important reasons and trade-offs in understandable language.
6. **Progressive Trust** — HeeraMon should earn permission progressively. Searching requires less trust than preparing an application, and submitting an application requires explicit user approval.
7. **AI-Assisted, Not AI-Dependent** — LLMs should handle language understanding, reasoning, ambiguity, and agentic decisions. Deterministic software should handle data storage, filtering, validation, scheduling, security, and other tasks where predictable behavior is preferable.

8. **Production-Oriented from the Start** — Even the first working version should have a sound architecture, clear separation of responsibilities, security considerations, testability, and an upgrade path toward larger-scale deployment.

## 5 Scope Philosophy

The product should remain small enough to finish and strong enough to prove the core concept.

The implementation should prioritize the complete core loop:

**Describe preferences → understand preferences → find jobs → evaluate jobs  
→ notify/discuss → user decides → assist with application**

Advanced features, large-scale infrastructure, extensive integrations, and unnecessary complexity should be postponed until the core experience works reliably.

## 6 Master Documentation Index

This document is the project's master reference. The following documents define specific aspects of HeeraMon and should remain consistent with this vision.

1. **Product Vision and Principles** — This document; product identity, philosophy, differentiation, and design principles.
2. **Software Requirements Specification (SRS)** — Functional and non-functional requirements.
3. **User Journeys and Use Cases** — User scenarios, workflows, and major interaction paths.
4. **AI / Agent Specification** — Agent architecture, tools, memory, reasoning, autonomy, and human-in-the-loop behavior.
5. **Job Ingestion Specification** — Job sources, fetching, parsing, normalization, deduplication, and ingestion pipeline.
6. **Matching and Preference Specification** — Hard constraints, soft preferences, learned preferences, matching, trade-offs, and decision logic.
7. **Technical Architecture Specification** — Frontend, backend, services, infrastructure, integrations, deployment, and extensibility.
8. **Data Model / Database Specification** — Entities, relationships, schemas, indexes, and persistence rules.
9. **UI / UX Specification** — Visual language, screens, interaction patterns, bird behavior, animations, and responsive design.
10. **API Specification** — Internal and external APIs, endpoints, contracts, authentication, and data exchange.
11. **Security and Privacy Specification** — Authentication, authorization, API keys,

CVs, personal data, secrets, and security requirements.

12. **Notification and Background-Agent Specification** — Scheduled searches, background execution, notifications, monitoring, and agent lifecycle.
13. **Application Automation Specification** — CV handling, application preparation, form filling, validation, approval, and submission.
14. **Testing and QA Specification** — Unit, integration, end-to-end, agent, UI, security, and reliability testing.
15. **Development Roadmap** — Development phases, priorities, milestones, dependencies, and definition of done.
16. **Future Evolution Notes** — Deliberately deferred ideas, scalability, monetization, integrations, and future capabilities.

## 7 Document Control

| Version | Date               | Author / Role         | Changes         |
|---------|--------------------|-----------------------|-----------------|
| 1.0     | September 29, 2026 | Product / Engineering | Initial release |

**Approval:** This document defines the product identity and guiding principles for HeeraMon. All subsequent specifications must remain consistent with the philosophy and principles stated herein.

*HeeraMon flies to help people find job that fits not only their career, but the life they want to live.*
