13 Scaling and Reliability	6
14 Long-Term Product Direction	7
15 Ideas to Keep in the Parking Lot	7
16 Evolution Principle	7
17 Document Control	8

1 Purpose

This document records potential directions for HeeraMon after the initial release.

These ideas are intentionally not current requirements. They provide an evolution path while preventing future ambitions from unnecessarily expanding the initial product.

Future development should be driven by real user behavior, technical evidence, and demonstrated product value.

2 Broader and Smarter Job Discovery

Potential improvements:

- Additional job sources.
- More company career-page integrations.
- Better source reliability monitoring.
- Improved deduplication across sources.
- Better handling of expired and updated postings.
- More sophisticated location and commute information.
- Better salary normalization.
- More employment-type and work-arrangement detection.
- Improved job-detail extraction.

The ingestion layer should continue using adapters so new sources do not require changes to the core system.

3 Better Preference Intelligence

Potential improvements:

- More nuanced preference relationships.
- Preference dependencies and conflicts.
- Temporary preferences.
- Context-specific preferences.
- Better detection of repeated behavioral patterns.
- Confidence-aware learned preferences.
- User-controlled preference history.
- More sophisticated trade-off explanations.

HeeraMon should become better at understanding what the user actually values without becoming opaque or overly presumptive.

4 Improved Matching and Reasoning

Potential improvements:

- Better structured job-to-preference comparison.
- Semantic similarity for skills and responsibilities.
- More advanced location and commute reasoning.
- Better salary and benefits comparison.
- Experience-level compatibility.
- Career-growth considerations.
- Improved uncertainty estimation.
- Personalized opportunity explanations.

Advanced ranking or machine-learning models should only be introduced when they solve a demonstrated problem that simpler methods cannot handle adequately.

5 More Application Integrations

Potential improvements:

- Additional ATS integrations.
- More supported application workflows.
- Better form-field mapping.
- Reusable application profiles.
- Better handling of unusual application questions.
- Application-progress tracking.
- Draft management.
- Application history and follow-up reminders.

Universal arbitrary-site automation remains a separate technical and safety problem rather than an assumed capability.

6 User-Controlled Agent Behavior

Users may eventually be able to configure how proactive HeeraMon should be.

Potential controls include:

- Search frequency.
- Notification density.
- Matching strictness.
- How aggressively trade-offs are considered.

- Whether HeeraMon asks before learning certain preferences.
- Which application steps can be automated.
- Which actions always require approval.

The objective is configurable autonomy, not maximum autonomy.

7 Personal Career Context

HeeraMon could eventually understand a broader picture of the user's professional situation.

Potential capabilities:

- Skills and experience timeline.
- Portfolio awareness.
- GitHub/project context.
- CV improvement suggestions.
- Skill-gap identification.
- Job-market trend summaries.
- Career-path exploration.
- Interview preparation.
- Personalized learning recommendations.

These capabilities should remain connected to the user's actual job-seeking goals rather than turning HeeraMon into a generic life assistant.

8 Richer Job and Company Intelligence

Potential capabilities:

- Company-level profiles.
- Historical hiring patterns.
- Compensation trends.
- Work-arrangement patterns.
- Benefits comparison.
- Public employee-review context.
- Company stability indicators.
- Team or role context where reliable information exists.

Information should be presented with clear provenance and uncertainty. HeeraMon should distinguish verified facts from estimates, user reports, and third-party claims.

9 Advanced Agent Architecture

If complexity eventually justifies it, HeeraMon could evolve beyond the initial single-agent architecture.

Possible specialized components could include:

- Job discovery agent.
- Job analysis agent.
- Preference reasoning agent.
- Application agent.
- Research agent.

This should only happen when measurable complexity or reliability requirements justify it.

The initial architecture should not assume that multiple agents are necessary.

10 Model and Infrastructure Evolution

Potential future improvements:

- Multiple LLM providers.
- User-selected models.
- BYOK support.
- Local or self-hosted models.
- Model routing based on task complexity.
- Caching and semantic retrieval.
- Vector databases where justified.
- More advanced background-job infrastructure.
- Horizontal scaling.
- Queue-based architectures.
- Dedicated observability infrastructure.

The provider abstraction established early should make model evolution possible without redesigning the entire product.

11 New Interfaces

Potential future interfaces include:

- Progressive Web App.
- Native mobile applications.

- Browser extension.
- Desktop companion.
- Messaging-based interface.
- Voice interaction.

The web application remains the primary interface for the initial release.

New interfaces should consume the same underlying product services rather than creating separate product logic.

12 Monetization and Productization

Potential future models include:

- Free personal tier.
- Paid advanced features.
- Premium agent usage.
- BYOK plans.
- Application automation limits.
- Career intelligence features.
- Team or institutional offerings.

Billing and subscription infrastructure should be introduced only after there is evidence of sustained user value.

13 Scaling and Reliability

As usage grows, future engineering may require:

- Dedicated background workers.
- Queue systems.
- Horizontal scaling.
- More advanced caching.
- Stronger observability.
- Distributed rate limiting.
- Job-source health monitoring.
- Automated recovery mechanisms.
- Data archival and lifecycle management.
- More comprehensive security controls.

The system should evolve incrementally rather than adopting distributed infrastructure prematurely.

14 Long-Term Product Direction

HeeraMon can eventually become more than a job-search interface.

The broader direction is a personal career decision assistant that understands:

- What work the user wants.
- What life the user wants.
- What trade-offs they are willing to make.
- What opportunities exist.
- What actions are worth taking.
- What the user has already decided.

However, the central philosophy should remain unchanged:

HeeraMon helps the user make better career decisions; it does not make those decisions for them.

15 Ideas to Keep in the Parking Lot

The following ideas may be interesting but should not influence the initial release unless evidence later justifies them:

- Multi-agent swarms.
- Fully autonomous job applications.
- Universal browser automation.
- AI-generated professional identity.
- Social networking features.
- Recruiter marketplace.
- Employer-side hiring platform.
- Large-scale career analytics.
- Gamification.
- Cryptocurrency or token systems.
- Complex autonomous negotiation.
- General-purpose personal assistant capabilities.

Ideas can be reconsidered later without being treated as commitments.

16 Evolution Principle

Future features should pass three questions:

1. Does this solve a real user problem?

2. Does the existing architecture need to evolve to support it?
3. Is the added complexity justified by the value it creates?

If the answer is unclear, the feature should remain experimental rather than becoming part of the core product.

Guiding Evolution Principle: The initial release proves the loop. Later versions improve the loop and expand what HeeraMon can understand and accomplish without losing user control.

17 Document Control

Version	Date	Author / Role	Changes
1.0	September 30, 2026	Product / Engineering	Initial release

Approval: This document records the intended evolution path for HeeraMon. Future development decisions should remain consistent with the principles stated herein.

HeeraMon flies to help people find job that fits not only their career, but the life they want to live.

Saadman Sakib
Product Engineer
